Field of the invention

The present invention relates to novel cyclized quinazolines which are useful for preparing medicinal products for treating complaints involving a therapy with a matrix metalloprotease-13 (MMP-13) inhibitor. These medicinal products are useful in particular for treating certain inflammatory conditions such as rheumatoid arthritis or osteoarthritis, as well as certain proliferative conditions such as cancers.

Technological background of the invention

Matrix metalloproteases (MMPs) are enzymes which are involved in the renewal of extracellular matrix tissue, such as cartilage, tendons and joints. MMPs bring about the destruction of the extracellular matrix tissue, which is compensated for, in a non-pathological physiological state, by its simultaneous regeneration.

Under normal physiological conditions, the activity of these extremely aggressive peptidases is controlled by specialized proteins which inhibit MMPs, such as the tissue inhibitors of metalloprotease (TIMPs).

In pathological situations, an irreversible degradation of articular cartilage takes place, as is the case in rheumatic diseases such as rheumatoid arthritis or osteoarthritis. In these pathologies, the cartilage degradation process predominates, leading to a destruction of the tissue and resulting in a loss of function.

At least twenty different matrix metalloproteases have been identified to date and are subdivided into four groups, the collagenases, the gelatinases, the stromelysins and the membrane-type MMPs (MT-MMPs), respectively.

Matrix metalloprotease-13 (MMP-13) is a collagenase-type MMP which constitutes the predominant collagenase observed during osteoarthritis, in the course of which pathology the chondrocyte directs the destruction of cartilage.

Local equilibrium of the activities of MMPs and TIMPs is critical for the renewal of the extracellular matrix. Modifications of this equilibrium which result in an excess of

20075654-02402

active MMPs, relative to their inhibitor, induce a pathological destruction of cartilage, which is observed in particular in rheumatoid arthritis and in osteoarthritis.

There is a need in the prior art for novel MMP inhibitors, more particularly for MMP-13 inhibitors, in order to prevent and/or correct the imbalance in the renewal of extracellular matrix tissue, as well as to prevent or treat conditions such as rheumatoid arthritis, osteoarthritis, osteoporosis, periodontal diseases, inflammatory bowel disease, psoriasis, multiple sclerosis, cardiac insufficiency, atherosclerosis, asthma, chronic obstructive pulmonary diseases (COPDs), age-related macular degeneration (ARMD) and cancer.

MMP-inhibitor compounds are known. Most of these MMP inhibitors are not selective for only one MMP, such as, for example, those which have been described by Montana and Baxter (2000) or by Clark et al. (2000).

There is a need in the prior art for novel inhibitors that are active on matrix metalloprotease-13 in order to enrich the therapeutic arsenal that can be used for treating pathologies associated with the destruction of the extracellular matrix and with cancer.

The invention also relates to the pharmaceutically acceptable salts of the compounds of formula (I). A review of the pharmaceutically acceptable salts will be found in J. Pharm. Sci., 1977, vol. 66:1-19. However, the expression "pharmacologically acceptable salts of a compound of formula (I) with a basic function" means the addition salts of the compounds of formula (I) formed from non-toxic mineral or organic acids such as, for example, the salts of hydrobromic acid, hydrochloric acid, sulphuric acid, phosphoric acid, nitric acid, acetic acid, succinic acid, tartaric acid, citric acid, maleic acid, hydroxymaleic acid, benzoic acid, fumaric acid, toluenesulphonic acid, isethionic acid and the like. The various quaternary ammonium salts of the compounds of formula (I) are also included in this category of compounds of the invention. In addition, the expression "pharmacologically acceptable salts of a compound of formula (I) with an acid function" means the usual salts of the compounds of formula (I) formed from non-toxic mineral or organic bases such as, for example, the hydroxides of alkali metals and of alkaline-earth metals (sodium, potassium, magnesium and calcium), amines (dibenzylethylenediamine, trimethylamine, piperidine, pyrrolidine, benzylamine and the like) or quaternary ammonium hydroxides such as tetramethylammonium hydroxide.

As mentioned above, the compounds of formula (I) of the present invention are matrix metalloprotease inhibitors, and particularly inhibitors of the enzyme MMP-13.

In this respect, their use is recommended in the treatment of diseases or complaints involving a therapy by MMP-13 inhibition. By way of example, the use of the compounds of the present invention may be recommended during the treatment of any pathology in which a destruction of the extracellular matrix tissue is involved, and most particularly pathologies such as rheumatoid arthritis, osteoarthritis, osteoporosis, periodontal diseases, inflammatory bowel disease, psoriasis, multiple sclerosis, cardiac insufficiency, atherosclerosis, asthma, chronic obstructive pulmonary disease (COPD), age-related macular degeneration (ARMD) and cancer.

Selectivity of the compounds of formula (I) for the enzyme MMP-13

Most of the matrix metalloprotease inhibitors described in the prior art are non-selective inhibitors, capable of simultaneously inhibiting several matrix metalloproteases.

For example, compounds such as CGS-27.023A and AG-3340 (Montana and Baxter

(2000)) simultaneously inhibit MMP-1, MMP-2, MMP-3, MMP-9 and MMP-13, i.e. these compounds of the prior art simultaneously inhibit MMPs of collagenase, gelatinase and stromelysin type.

It has been shown according to the invention that the compounds of general formula (I) constitute selective MMP-13 inhibitors.

The expression "selective inhibitor" of MMP-13 means a compound of formula (I) whose IC₅₀ value for MMP-13 is at least 5 times lower than the IC₅₀ value measured for a matrix metalloprotease other than MMP-13, and preferably at least 10 times, 15 times, 20 times, 30 times, 40 times, 50 times, 100 times or 1 000 times lower than the IC₅₀ value measured for a matrix metalloprotease other than MMP-13.

The expression "matrix metalloprotease other than MMP-13" preferably means an MMP selected from MMP-1, MMP-2, MMP-3, MMP-7, MMP-9, MMP-12 and MMP-14.

In particular, it has been shown according to the invention that the compounds of general formula (I), and more particularly the family of compounds given as examples in the present description, have an IC₅₀ value for the enzyme MMP-13 which is generally 1 000 times less than the value of their IC₅₀ for other matrix metalloproteases, in particular MMP-1, MMP-2, MMP-3, MMP-7, MMP-9, MMP-12 and MMP-14.

The result of this is that the compounds of general formula (I) according to the invention are particularly useful for treating complaints mainly associated with a physiological imbalance between the MMP-13 enzymes and their natural tissue inhibitors.

PHARMACEUTICAL FORMULATION OF THE COMPOUNDS OF THE INVENTION

A subject of the present invention is also a pharmaceutical composition comprising a compound of general formula (I) as defined above and a pharmaceutically acceptable excipient.

The invention also relates to the use of a compound of general formula (I) as defined above for the preparation of a medicinal product intended for treating a disease or complaint involving therapy by inhibition of matrix metalloproteases, and more

particularly a disease or complaint involving therapy by inhibition of type-13 matrix metalloprotease (MMP-13).

An MMP-13-inhibitor compound of general formula (I) according to the invention is particularly useful for treating all pathologies brought about by a degradation of the extracellular matrix tissue, and more particularly for treating rheumatoid arthritis, osteoarthritis, osteoporosis, periodontal diseases, inflammatory bowel disease, psoriasis, multiple sclerosis, cardiac insufficiency, atherosclerosis, asthma, chronic obstructive pulmonary diseases (COPDs), age-related macular degeneration (ARMD) and cancer.

In an entirely preferred manner, a compound of general formula (I) as defined according to the invention will be used to treat arthritis, osteoarthritis and rheumatoid arthritis.

The compounds of the invention are administered in the form of compositions that are suitable for the nature and gravity of the complaint to be treated. The daily dosage in man is usually between 2 mg and 1 g of product which may be absorbed in one or more dosage intakes. The compositions are prepared by methods that are common to those skilled in the art and generally comprise 0.5% to 60% by weight of active principle (compound of formula I) and 40% to 99.5% by weight of pharmaceutically acceptable vehicle.

The compositions of the present invention are thus prepared in forms that are compatible with the desired route of administration. By way of example, the following pharmaceutical forms may be envisaged, although the list given below is not limiting:

1) Forms for oral administration:

Drinkable solutions, suspensions, sachets of powder for drinkable solution, sachets of powder for drinkable suspension, gastro-resistant gel capsules, sustained-release forms, emulsions, HPMR capsules or gel capsules, or lyophilizates to be melted under the tongue.

2) Forms for parenteral administration:

Intravenous route:

Aqueous solutions, water/cosolvent solutions, solutions using one or more solubilizing agents, colloidal suspensions, emulsions, nanoparticulate suspensions which can be used for the injection of sustained-release forms, dispersed forms and liposomes.

Subcutaneous/intramuscular route:

- 5 In addition to the forms which can be used intravenously and which can also be used for the subcutaneous and intramuscular routes, other types of forms such as suspensions, dispersed forms, sustained-release gels and sustained-release implants may also be used.

3) Forms for topical administration:

- 10 Among the most common topical forms that are distinguished are creams, gels (aqueous phases gelled with polymers), patches, which are dressings to be stuck directly onto the skin and which can be used to treat dermatosis without percutaneous penetration of the active substance, sprays, emulsions and solutions.

4) Forms for pulmonary administration

- 15 Forms such as solutions for aerosols, powders for inhalers and other suitable forms are distinguished in this category.

5) Forms for nasal administration:

This especially relates herein to solutions for drops.

6) Forms for rectal administration:

- 20 Suppositories and gels will be selected, inter alia.

It is also possible to envisage using forms allowing the administration of ophthalmic solutions or allowing the vaginal administration of the active principle.

Another important category of pharmaceutical form which may be used in the context of the present invention relates to forms for improving the solubility of the active principle. By way of example, it may be envisaged to use aqueous solutions of cyclodextrin, and more particularly forms comprising hydroxypropyl- β -cyclodextrin. A detailed review of this type of pharmaceutical form is presented in the article published under the reference Journal of Pharmaceutical Sciences, 1142-1169, 85, (11), 1996, and incorporated into the present patent application by reference.

The various pharmaceutical forms recommended above are described in detail in the book "Pharmacie galénique" by A. Lehir (published by Masson, 1992 (6th edition)), which is incorporated into the present patent application by reference.

PROCESSES FOR SYNTHESIZING INTERMEDIATE COMPOUNDS THAT ARE USEFUL FOR MANUFACTURING A CYCLIZED QUINAZOLINE OF FORMULA (I)

A. First process

This process makes it possible to achieve the synthesis of intermediate compounds that are useful in the manufacture of the compounds of general formula (I) in which W is C-R₁, X is N and R₁, R₃, R₄, Y, Z, Z₁, n, m and A are as defined more generally in the present description.

This process is illustrated in Scheme 1 below:

Scheme 1

In Scheme 1 above, T₁ represents an exchangeable group, for example bromine, or a protecting group such as, for example, COOEt, and T₂ represents a group selected from aryl, alkyl and cycloalkyl.

In this process, the 2-hydrazino 3,4-dihydroquinazolin-4-one (1a) is coupled, in a first stage, with an alkylcarboxylic, cycloalkylcarboxylic or arylcarboxylic acid chloride (or optionally a phosgene derivative) to give the corresponding hydrazide intermediate, which is cyclized, in a second stage, into a 1-alkyl, cycloalkyl or aryl (or optionally hydroxyl) triazolo[4,3-a]quinazolin-5-one (1b), by heating in a suitable solvent. It is clearly understood that the acid chloride reagent T₂-COCl may be replaced with a reactive derivative of the acid, such as an orthoester.

The process for synthesizing intermediate compounds (1a) is disclosed in the PCT patent application published under No. WO 00/66584.

B. Process 2

This process also constitutes a method for synthesizing intermediates that are useful in the manufacture of compounds of formula (I) in which W is C-R₁, X is N and R₁, R₃, R₄, Y, Z, Z₁, n, m and A are as defined more generally in the present description.

This process is illustrated in Scheme 2 below:

Scheme 2

Methyl 4-aminoisophthalate (2a) is treated with benzyl isothiocyanate, in a solvent such as pyridine or acetic acid, to give 3-benzyl-6-(methoxycarbonyl)-2-thioxo-1,2,3,4-tetrahydroquinazolin-4-one (2b). This compound is heated, in a refluxing alcohol, in the presence of hydrazine hydrate to give the corresponding hydrazine which is in turn cyclized by reaction with a carboxylic acid derivative R₁COOH (such as an acid chloride or an orthoester). The 4-benzyl-7-(methoxycarbonyl)-4,5-dihydrotriazolo[4,3-a]quinazolin-5-one (2d) obtained is N₄-debenzylated using aluminium chloride in benzene, and the intermediate secondary lactam is then substituted with a halide, in the presence of a base such as cesium carbonate, in a solvent such as dimethylformamide. The N-substituted

analogue obtained (2f) is then hydrolysed, preferably in acidic medium, to give the corresponding acid (2g) which may be subsequently subjected to a coupling reaction of peptide type.

- 5 The order of the steps in the above process may be modified for the synthesis of certain compounds. For example, when R_3 is para-cyanobenzyl, step 5 will be carried out last since the para-cyanobenzyl group would not withstand the conditions of step 6.

C. Process 3

- 10 This process allows the preparation of intermediate compounds that are useful for manufacturing compounds of formula (I) in which W is C- R_1 , X is C- R_2 and R_1 , R_2 , R_3 , R_4 , Y, Z, Z_1 , n, m and A are as defined more generally in the present description.

This preparation process is illustrated in Scheme 3 below:

10075654.021402

Scheme 3

3-Benzyl-6-bromo-2-thioxo-1,2,3,4-tetrahydroquinazolin-4-one (3a) is treated, depending on the case, with a 2-amino acetal or a 2-amino ketone, in an alcoholic solvent such as methanol or ethanol, in the presence of a peroxide for initiating the oxidation of the starting thiol and converting it, depending on the circumstance, into a better exchangeable group. The intermediate amino ketone (3d) or amino acetal (3b) obtained is readily cyclized in the presence of acid, in an alcoholic solvent such as isopropanol, into 4-benzyl-6-bromo-4,5-dihydroimidazo[1,2-a]quinazolin-5-one (3c) or (3e) depending on the desired degree of substitution. The bromine atom in position 7 may then be subsequently exchanged with a potential carboxylic function (see, for example, Scheme 5).

D. Process 4

This process allows the synthesis of intermediate compounds that are useful for preparing compounds of formula (I) in which W is N, X is C-R₂ and R₂, R₃, R₄, Y, Z, Z₁, n, m and A are as defined more generally in the present description.

5 This process is illustrated in Scheme 4 below:

5-Bromo-2-hydrazinobenzoic acid (4a) is treated with an alkyl N-cyanoimidate to give the 4-benzyl-6-bromo-4,5-dihydrotriazolo[2,3-a]quinazolin-5-one (4b) in a single step. This compound is substituted with a halide, in the presence of a base such as cesium carbonate, in a solvent such as dimethylformamide, to give the N4-substituted analogue (4c). The bromine atom in position 7 may then be subsequently exchanged with a potential carboxylic function (see, for example, Scheme 5).

E. Process 5

15 This process illustrates a preferred embodiment of intermediate steps for synthesizing a compound of formula (I) according to the invention, by which the substituent R₃ is introduced into some of the intermediate compounds whose preparation is illustrated by Processes 1 to 4 described above or by Scheme 5 below.

This process for synthesizing intermediate compounds in the manufacture of the compounds of formula (I) according to the invention is illustrated in Scheme 5 below.

Scheme 5

5 In Scheme 5 above, T_3 represents a $(\text{C}_1\text{-C}_6)\text{alkyl}$.

4-Benzyl-7-bromo-4,5-dihydrotriazolo[4,3-a]quinazolin-5-one, triazolo[2,3-a]quinazolin-5-one or imidazo[4,3-a]quinazolin-5-one (5a) is converted into the corresponding 7-cyano derivative (5b) by an exchange reaction with copper cyanide, in a solvent such as N-methylpyrrolidinone. The nitrile function is hydrolysed in acidic medium, for example in the presence of sulphuric acid, and the carboxylic acid (5c) obtained is then esterified to (5d) with an alcohol in acidic medium. This intermediate is

then N4-debenzylated with aluminium chloride, in a solvent such as benzene, and substituted with a halide to give compound (5f), in the presence of a base such as sodium hydride or cesium carbonate, in a solvent such as dimethylformamide or N-methylpyrrolidinone.

The ester (5f) is finally hydrolysed, in acidic medium, to a corresponding carboxylic acid (5g).

The first two steps of Scheme 5 above also apply to the intermediates described above into which R3 has already been introduced.

F. Process 6

This process allows the synthesis of intermediate compounds that are useful for manufacturing compounds of formula (I) in which W is N, X is N and R₃, R₄, Y, Z, Z₁, n, m and A are as defined more generally in the present description.

Scheme^o6

The process for synthesizing intermediate compounds (6a) is disclosed in the PCT patent application published under WO 00/66584.

The group T₄ represents a protecting group such as CO₂Me or an exchangeable group such as a halogen.

The quinazolin-4-one (6a) may be converted into the 4,5-dihydrotriazolo[4,5-a]quinazolin-5-one (6b) by the action of triflic anhydride and sodium azide in a solvent such as acetonitrile.

Instead of the reagents indicated, phosphorus pentachloride and trimethylsilyl azide may also be used to carry out this cyclization.

PROCESSES FOR SYNTHESIZING THE COMPOUNDS OF FORMULA (I).**A. PROCESS 1**

5 This process allows the synthesis of compounds of formula (I) in which Y is an oxygen and W, X, R₃, R₄, Z, Z₁, n, m and A are as defined more generally in the present description.

This first process for synthesizing compounds of formula (I) is illustrated in Scheme 7 below:

10075654.021402

Scheme^o7**Method B**

In Scheme 7 above, hal represents a halogen, R₈ represents a hydrogen, a (C₁-C₆)alkyl, an aryl(C₁-C₆)alkyl, a cycloalkyl, an aryl or a heteroaryl, Ra represents a hydrogen, a (C₁-C₆)alkyl, an aryl, an aryl(C₁-C₆)alkyl, an aromatic or non-aromatic heterocycle or a cycloalkyl, and R represents the group

in which A, R₄, Z₁, m and n are as defined in the compound of general formula (I).

4-Benzyl-7-bromo-4,5-dihydrotriazolo[4,3-a]quinazolin-5-one, triazolo[2,3-a]quinazolin-5-one or imidazo[4,3-a]quinazolin-5-one (5a) bearing an R₃ substitution in position 4 (7a) may be converted into the corresponding ester (7c) or amide (7d) by the direct method A, i.e. coupling with a halide in the presence of a base or activation of the acid function, for example with TOTU, in the presence of DIPEA, followed by displacement of the activated function with an amine; the ester (7c), the amide (7d), the thio acid (7e) or the ketone (7f) may also be obtained by an indirect method B: the acid is converted into the acid chloride (7b) by reaction with thionyl chloride and this compound is then reacted either with an alcohol to give the ester (7c), or with an amine to give the amide (7d), or with a thiol to give the thio ester (7e), or with an organomagnesium reagent to give the ketone (7f).

B. Synthetic process 2

The second preferred process for synthesizing a compound of formula (I) according to the invention allows the manufacture of compounds of formula (I) in which Y is S and W, X, R₃, R₄, Z, Z₁, m, n and A are as defined more generally in the present description.

This process consists essentially in reacting a compound of formula (I) in which Y is O with a suitable reagent, for example Lawesson's reagent.

The said process is illustrated in Scheme 8 below:

4,5-Dihydrotriazolo[4,3-a]quinazolin-5-one, triazolo[2,3-a]quinazolin-5-one or imidazo[4,3-a]quinazolin-5-one bearing an oxygenated function in position 7 (8a; Z = C, O, N) may be converted into the sulphur-containing analogue (8b) by reaction with a reagent such as P₂S₅ or Lawesson's reagent.

C. Synthetic process 3

According to this third process for synthesizing a compound of formula (I), a compound of formula (I) is prepared in which Y is NH, Z is O, N or S and W, X, R₃, R₄, Z₁, m, n and A are as defined more generally in the present description.

This third process for synthesizing compounds of formula (I) is illustrated in Schemes 9 and 10 below:

In the above scheme, hal represents a halogen atom and R₈ represents a hydrogen, a (C₁-C₆)alkyl, an aryl(C₁-C₆)alkyl, a cycloalkyl, an aryl or a heteroaryl.

4,5-Dihydrotriazolo[4,3-a]quinazolin-5-one, triazolo[2,3-a]quinazolin-5-one or imidazo[4,3-a]quinazolin-5-one bearing a nitrile function in position 7 (9a) may be converted into the corresponding imide (9b) by addition of an alcohol R-OH to the nitrile function, into the corresponding amidine (9c) by addition of an amine R-NH-R₈ to the nitrile function, into the thioimide by addition of a thiol R-SH to the nitrile function, or into the imine by addition of an organomagnesium reagent.

The compounds obtained after the process described in Scheme 9 may be reacted with a group R-X in which R is a (C₁-C₆)alkyl and X is an exchangeable group such as a halogen, in the presence of a base, to give a compound of general formula (I) in which Y is N-R.

5

Scheme 10

In the above scheme, R represents a lower alkyl and Ra represents a hydrogen, a lower alkyl, an aryl, an aralkyl, an aromatic or non-aromatic heterocycle or a cycloalkyl.

The present invention is also illustrated, without, however, being limited thereto, by the examples which follow:

0.7 g (1.9 mmol) of *N*-(3,4-methylenedioxybenzyl)-4*H*-[1,2,4]triazolo[4,3-*a*]-5-oxo-quinazol-7-yl carboxamide in suspension in 20 ml of dimethylformamide and 0.62 g (1.9

mmol) of cesium carbonate are placed in a reactor fitted with a stirring system. The mixture is stirred 15 minutes at room temperature and 0.372 g (1.9 mmol) of 4-cyanobenzyl bromide is added. The reaction mixture is stirred at 90°C for 12 hours and concentrated under vacuum. The residu obtained is taken up in a mixture of water and dichloromethane. The organic phase is separated, washed with brine and evaporated under vacuum. A chromatography of the residu over silica gel (dichloromethane/methanol : 95/5) yield 0.55 g (60%) of the desired compound pure on TLC. A recrystallisation from acetonitrile give 0.32 of uncolourless crystals.

Example 28: Evaluation of the in vitro activity of the MMP-13-inhibitor compounds according to the invention.

The inhibitory activity of the compounds of formula (I) according to the invention with respect to matrix metalloprotease-13 was evaluated by testing the ability of the compounds of the invention to inhibit the proteolysis of a peptide substrate with MMP-13.

The peptide substrate used in the test is the following peptide: Ac-Pro-Leu-Gly-thioester-Leu-Leu-Gly-OEt.

The inhibitory activity of a compound of formula (I) according to the invention is expressed as the IC₅₀ value, which is the concentration of inhibitor for which an inhibition of 50% of the activity of the matrix metalloprotease under consideration is observed.

To carry out this test, a reaction medium of 100 μl volume is prepared, containing: 50 mM of HEPES buffer, 10 mM of CaCl₂ and 1 mM of 5,5'-dithiobis(2-nitrobenzoic acid) (DTNB), and 100 μM of substrate, the pH being adjusted to 7.0.

Increasing concentrations of the inhibitory compound present in a 2.0% DMSO solution and 2.5 nM of the catalytic domain of human MMP-13 are added to the test samples.

The concentrations of inhibitors present in the test samples range from 100 μM to 0.5 nM.

The measurement of the proteolysis of the substrate peptide is monitored by measuring the absorbance at 405 nm using a spectrophotometric machine for reading

microplates, at the laboratory temperature, the measurements being carried out continuously for 10 to 15 minutes.

The IC₅₀ values are calculated from the curve in which the percentage of the catalytic activity relative to the control is represented on the X-axis and the concentration of inhibitor is represented on the Y-axis.

The IC₅₀ values on MMP-13 of the compounds of Examples 1 to 6 are given in Table 1 below.

Table 1

Example	IC ₅₀ (μM)
1	0.0034
2	0.0023
3	0.0040
4	0.040
5	0.165

The test described above for the inhibition of MMP-13 was also adapted and used to determine the ability of the compounds of formula (I) to inhibit the matrix metalloproteases MMP-1, MMP-2, MMP-3, MMP-7, MMP-9, MMP-12 and MMP-14.

The results obtained show that the cyclized quinazoline compounds according to the invention generally have IC₅₀ values for MMP-13 which are about 100 times lower than the IC₅₀ values for the same compounds with respect to the other matrix metalloproteases tested.
